Working smarter with energy

By Marjon van Diepen

Since 2022, all Dutch DFG companies have been using green electricity, and since 2024 JZ Flowers in the UK has joined as well. This is an important step in reducing our footprint. However, more can be done.

To gain better insight into energy consumption per company, Michiel van Eerden and Harry Brockhoff have worked over the past month on a fair allocation model. In three groups – large consumers, small consumers and plant companies – stakeholders were presented with insights into purchased energy and total kWh usage across DFG.

The message is clear: critically assess your own energy consumption and develop an action plan to reduce electricity and gas usage. This is not only beneficial for the environment, but also directly visible in cost savings.

They also shared several practical points of attention, such as door timers, temperature settings, and agreements on temperatures at which products are delivered and transported. Small improvements can already make a significant difference.
