Update on SBTi targets

DFG has committed to significantly reducing greenhouse gas emissions by 2031 (compared to 2021). We are on track, but further acceleration is required. Below are the key insights.

Scope 1 & 2: Own operations
Target: -58%; achieved up to 2024: -63%.

We are ahead of schedule. Emissions are monitored via the impact dashboard, with the 2025 update planned for April. The main area of attention remains refrigerant leakage, particularly at AirFlo Kenya.

Scope 3: Purchased goods & transport
Target: -47%; achieved in 2024: -15%.

We encourage growers to gain insight into their footprint through the FloriPEF methodology, enabling them to take control of their own reductions. Internationally, we see good progress, but in the Netherlands this is lagging behind. Further scaling and pressure from the business are needed to accelerate progress. Within the footprint working group, the current focus is particularly on our retail companies, as their customers are increasingly requesting footprint calculations.

In terms of transport, the greatest impact lies in reducing air freight and increasing sea freight. There are clear opportunities here to accelerate progress.

Conclusion: we are making progress, but additional focus and action across the entire supply chain are needed to achieve our targets.
